## Cut The Scrap!

**With the Repeater™ Valve from U.S.Valves**

*The concept is disarmingly simple.*

When you first install a Repeater™ Valve, you'll be surprised at how quickly it pays for itself. Eliminate inconsistent closing and the expensive scrap parts that go with it—and increase your CPK with more consistent runs, little variation and virtually no flyers.

No more short shots, no flash—now you can expect all your parts to be uniform.

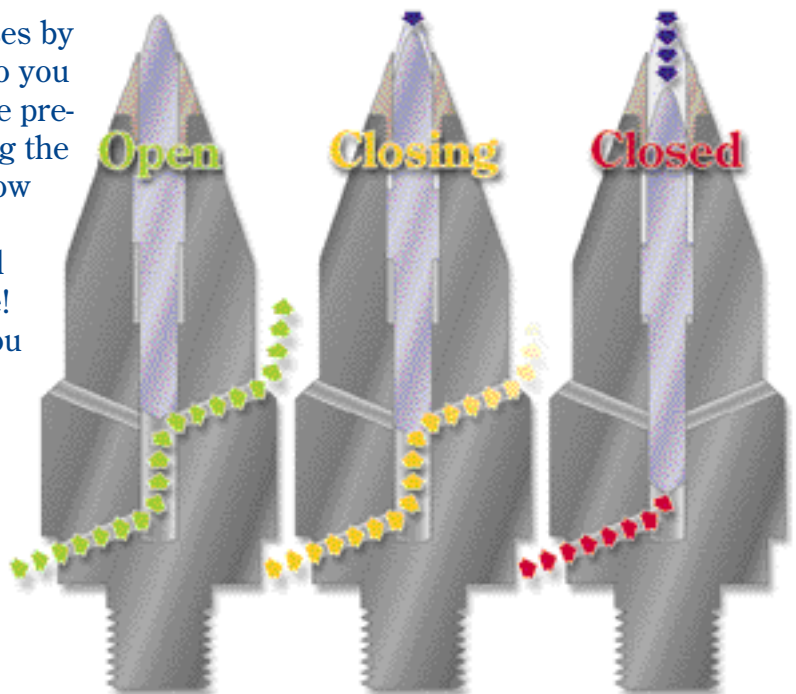

Before the Repeater™ Valve, your customers (and their quality control requirements) would reject variations in shape, size or weight. But now, with the Repeater™ Valve, *you* can precisely control the variation, eliminating many secondary operations that would take the machine operator or additional employees away from productive tasks.

*Save time. Save money. Save on wasted materials. Eliminate inconsistency. Increase CPK. Increase quality. Increase profits. Get the Repeater™ Valve today.*

### How Does It Work?

The Repeater™ Valve closes by pressure, not by flow—so you can exercise unbelievable precision by simply changing the position of the piston. Flow opens the valve, but you close it—dependably and precisely—with pressure!

What this means for you and your business is *dependable execution*, time and time again; less scrap; less material cost; more consistent parts *and more profit!*
